Abstract

The growing demand for special occasion dresses, combined with the high costs of purchasing garments that are often worn only once, has created a significant challenge for many women. The Dresses purchased for weddings, graduations, engagements, and formal events frequently remain unused after a single occasion, leading to financial waste and underutilization of valuable fashion items. At the same time, many customers seek affordable alternatives to purchasing expensive dresses for short-term use.

GlamShare is an online digital platform designed to facilitate the rental and reservation of occasion dresses through a centralized and user-friendly marketplace. The platform enables dress owners to showcase their dresses by providing detailed descriptions, images, rental pricing information, and availability schedules. Customers can browse available dresses, apply search and filtering options, submit rental requests, and manage reservations efficiently. The proposed system aims to simplify the interaction between dress owners and customers while promoting sustainability and reducing unnecessary spending. In addition, the platform incorporates essential features such as user authentication, dress management, reservation tracking via interactive calendars, reviews and ratings, and administrative supervision to ensure reliability. By leveraging software engineering methodologies, GlamShare provides an organized, secure, and efficient solution that enhances user experience and encourages the reuse of fashion items.

Keywords: GlamShare, Dress Rental, Online Marketplace, Sustainable Fashion, Reservation System.

Chapter 1

Introduction

1.1 Introduction

The rapid advancement of information technology has transformed traditional business models into digital platforms that provide faster, more efficient, and user-centered services. The fashion industry is one of the sectors that has greatly benefited from this digital transformation. Online marketplaces have changed the way customers search for, purchase, and rent products, making services more accessible than ever before.

Occasion dresses represent a unique challenge within the fashion market. Most dresses are purchased for specific events and are rarely worn again. Consequently, customers often spend large amounts of money on garments with limited future use. At the same time, many dress owners possess high-quality dresses that remain unused for long periods. GlamShare aims to bridge this gap by providing an integrated platform where users can rent occasion dresses, enabling customers to access a wide range of options at affordable prices. The project introduces a digital solution that simplifies communication, booking management, and transaction processing while ensuring convenience and trust among users.

1.2Project Scope

The GlamShare system provides an online web platform that connects dress owners with customers who are interested in renting occasion dresses. The website allows users to advertise their dresses by uploading images, descriptions, rental rates, and availability information, helping them reach a larger audience.

The system will include functional modules for user registration, secure login, profile management, searching, and advanced multi-criteria filtering (by size, color, style, occasion, and price). Customers can submit rental requests, manage reservations using a synchronized calendar, save favorite items, and leave ratings and reviews after completing transactions. An administrative control panel will be designed to supervise users, listings, and system safety. The project focuses strictly on system analysis and design artifacts (such as UML modeling and database design) and does not include the physical programming implementation or payment gateway integration. In conclusion, GlamShare simplifies the dress rental and reservation process, making it more efficient and user-centered.

1.3Problem Specification

When it comes to weddings, graduations, or any major event, many girls struggle to find dresses that make them feel comfortable and look their best. Many times they end up purchasing a new gown for each party they attend, even if they wear that gown only once. After the event, these beautiful dresses just lie in wardrobes, resulting in an obvious financial waste.

Currently, there are no formal platforms that provide an organized way to rent occasion gowns. As a result, girls have to depend on fragmented networks like scattered social media pages, forum posts, and instant messaging groups. This manual interaction causes severe operational challenges: information is widely distributed, the search process is slow, listings are often outdated, and there is no real-time availability tracking. This lack of automation leads to frequent scheduling conflicts, double-bookings, and an inability to track active versus pending reservations. Consequently, customers spend excessive money on "one-time"

dresses, while owners miss opportunities to generate income from their unused wardrobe assets. Therefore, a centralized, automated platform is urgently needed to streamline bookings and deliver a reliable experience for both parties.

1.4 Goals and Objectives

The primary goal of this project is to analyze and design a single web platform (GlamShare) that allows users to rent occasion dresses with ease, organization, and reliability.

The specific objectives are:

1. **Automate Reservations: Design a reliable booking mechanism with an interactive calendar control to track dress availability and eliminate scheduling conflicts.**
2. **Promote Economic Sustainability: Provide an intuitive environment that helps dress owners monetize their unused clothing while offering renters affordable alternatives to reduce unnecessary spending.**
3. **Enhance User Search Experience: Formulate a user-friendly, responsive interface that includes advanced multi-criteria filtering to minimize browsing hassle.**
4. **Establish User Trust: Integrate a transparent feedback and rating subsystem to ensure quality control and accountability between peers.**
5. **Conduct a Questionnaire: Design and deploy a user survey to collect feedback from potential users, helping to identify clear system requirements based on market needs.**
6. **Improve System Design: Take user feedback from surveys to improve the proposed system design based on real user feedback.**
7. **Apply Software Engineering Concepts: Apply rigorous requirements analysis, systematic system modeling (UML frameworks), and relational database schema design on a realistic case study.**

1.5 Motivation

The idea of GlamShare was inspired by a common societal challenge: the high financial cost of occasion wear contrasted with its extremely low utilization rate. Many individuals own beautiful, expensive dresses that sit idle in closets, while others search for affordable options for their special events. This project aims to deliver a practical solution to this need while promoting sustainable clothing reuse. Academically, the project provides an excellent opportunity for our team to apply core Software Engineering concepts—such as requirements elicitation, UML diagramming, and data architecture engineering—to a highly relevant case study under the supervision of Dr. Emad Saadeh.

1.6 System Requirement

To properly document and support the designed software architectures, the system identifies the following baseline resources:

1.6.1 Hardware Requirements

- **Personal Computer or Laptop suitable for documentation and modeling tools**
- **Internet Connection: High-speed access for research and cloud-based team collaboration.**

1.6.2 Software Requirements

- **Modern Web Browser: Google Chrome, Firefox, or Edge for interface research.**
- **UML Modeling Tools: StarUML, Lucidchart, or Visual Paradigm to build**

system diagrams.

- **UI/UX Mockup Software: Figma or Microsoft PowerPoint to design the interface wireframes.**
- **Office Suite: Microsoft Word to document the project report.**

1.7 Project Plan and Schedule

To ensure a systematic execution of the software engineering processes within the academic semester, the team's workflow has been structured into seven sequential phases as detailed in the table below:

Phase	Milestone Activity	Description
Phase 1	Project Selection	Defining the system concept, formulating the title, and allocating initial team responsibilities.
Phase 2	Requirements Elicitation & Survey	Designing and deploying a targeted questionnaire with over 40 participants to capture real user constraints.
Phase 3	System Scope & Boundaries	Setting up the functional boundaries of the system, applying corrections, and finalizing scope management.
Phase 4	Object-Oriented UML Modeling	Constructing formal structural and behavioral diagrams (Use Case, Activity, and Sequence Diagrams).
Phase 5	Database Architecture Design	Building the relational Database Schema and mapping Entity-Relationship Diagrams (ERD).

Phase 6	Comprehensive Documentation	Aggregating survey feedback analysis, refining textual layouts, and verifying template standards.
Phase 7	Final Review & Milestone Delivery	Conducting rigorous engineering evaluations and submitting the Phase 1 technical specification report.

Table 1.1: Project Plan and Schedule

1.8 Outline of the Project

The remainder of this report is organized as follows:

- **Chapter One (Introduction): Presents the project background, project scope, problem specification, goals and objectives, motivation, system requirements, and project plan.**
- **Chapter Two (Literature and Methodology): Reviews related systems, compares their advantages and disadvantages, presents the proposed system, includes a feasibility study, and explains the selected software development methodology.**
- **Chapter Three (System Analysis and Design): Describes requirement collection techniques, requirement analysis, requirement modeling, DFDs, UML diagrams, scenarios, class diagrams, and database schema.**
- **Chapter Four (System Implementation): Presents the technologies used, implementation details, sample user interfaces, reports, and pseudocode.**
- **Chapter Five (System Testing): Explains the testing plan, testing methods, and testing results.**
- **Chapter Six (Conclusions): Summarizes the project outcomes and discusses future work.**

Chapter Two

Literature REVIEW and Methodology

2.1 Introduction

The rapid growth of digital technology has transformed the way people access and rent products and services. Online platforms have become an essential part of everyday life by providing convenient, secure, and efficient solutions for users. In the fashion industry, particularly for occasion dresses, many individuals purchase expensive dresses that are worn only once or twice before remaining unused. At the same time, other users search for affordable rental options but often rely on social media platforms that lack proper organization and booking management.

This chapter reviews the academic literature and existing digital platforms related to fashion rental, examines the current local practice for renting occasion dresses, identifies its limitations, and presents the proposed GlamShare system. It also discusses the feasibility of the project and the Software Development Life Cycle (SDLC) methodology adopted during system analysis and design.

2.2 Literature Review

Fashion rental has attracted growing academic attention over the past decade as part of the wider collaborative consumption and sharing-economy movement. This section reviews relevant studies on fashion rental platforms, consumer behaviour, and business models, in order to position GlamShare within the existing body of knowledge.

2.2.1 Fashion Rental as a Business Model

Fashion rental has been studied primarily from two angles: the consumer perspective and, more recently, the business or platform perspective. Arrigo (2022) analysed the business models of digital fashion rental platforms and found that most academic work had concentrated on consumer motivations, leaving the operational and enterprise side of these platforms comparatively under-researched. This gap is relevant to GlamShare, since the project is concerned not only with user experience but also with how dress owners manage availability and bookings.

Clothing rental is also increasingly framed in the literature as a circular-economy practice that extends the usable life of a garment and reduces the environmental footprint associated with fast fashion, since a single item can serve multiple wearers instead of being discarded after limited use.

2.2.2 Consumer Motivations and Concerns

Several studies report that consumers rent occasion wear mainly to access variety, keep up with trends, and avoid the cost of purchasing garments worn only once, which aligns closely with the problem GlamShare aims to address. At the same time, the literature consistently identifies barriers to adoption, including a lack of trust between renter and lender, hygiene concerns, and fear of damaging a borrowed item, as summarized in reviews of the collaborative fashion consumption field. A more recent systematic review by Song et al. (2025) synthesised 68 peer-reviewed studies and proposed an integrative framework of the factors driving consumer adoption of fashion rental, reinforcing that trust, convenience, and platform design are central to a renter's decision to use a service rather than buy.

These findings support two of GlamShare's core design decisions: the inclusion of a review and rating system to build trust between users, and a structured booking process to replace the informal, trust-dependent exchanges that currently take place over social media.

2.2.3 Existing Digital Platforms

Beyond the academic literature, several commercial platforms already operate in the fashion rental space and provide useful points of comparison for GlamShare. Rent the Runway, established in 2009, is one of the most established international platforms; it operates a subscription and pay-per-rental model, giving users access to a continuously rotating inventory of designer garments sourced from wholesale and brand partnerships, together with search, personalised recommendations, and a logistics system for shipping and returns. Reviews of the wider sharing-economy literature note that platforms such as this rely heavily on centralised inventory management, digital cataloguing, and automated booking to operate at scale, which is precisely the type of functionality missing from the informal, social-media-based process currently used locally.

However, platforms such as Rent the Runway are retailer-owned: the company purchases and holds its own inventory rather than connecting independent dress owners directly with customers. GlamShare instead adopts a peer-to-peer model, similar in spirit to the local social-media groups it replaces, but adds the centralised search, booking, and review features associated with established commercial platforms. This positions GlamShare as a hybrid between informal local exchange and structured commercial rental systems.

2.2.4 Research Gap

The reviewed literature shows that fashion rental research has largely focused on large international platforms and general consumer attitudes, while comparatively little attention has been given to small-scale, peer-to-peer rental systems in local or regional markets. GlamShare addresses this gap by providing a centralised, locally relevant platform that combines the trust-building features identified in the literature (reviews, secure booking, verified listings) with the flexibility of a peer-to-peer marketplace. Furthermore, GlamShare specifically addresses the needs of the Palestinian community where no dedicated, localized platform currently exists for occasion dress rental and reservation.

2.3 Current System

Currently, most dress rental activities are conducted through social media platforms such as Facebook, Instagram, and WhatsApp. Although these platforms allow users to advertise dresses, they are not specifically designed for rental and reservation management.

The current manual approach suffers from several functional limitations:

- No centralized platform dedicated exclusively to renting and reserving dresses.
- Fragmented and manual communication between customers and dress owners.
- Extreme difficulty in tracking real-time dress availability.
- No dynamic calendar or structured reservation management, which leads to a high risk of scheduling conflicts and double bookings.
- Limited or non-existent search and advanced filtering capabilities.
- Lack of secure, automated booking confirmations.

No transparent customer review or rating system to establish trust.

These limitations often lead to poor user experience and inefficient reservation management, and they mirror the trust and convenience barriers identified in the literature reviewed in Section 2.2.

2.4 Comparative Analysis

Table 2.1 presents a comprehensive comparison between the current local practice (social media), an established international platform (Rent the Runway), and the proposed GlamShare system based on the architectural features most relevant to this project.

Table 2.1: Comparison of the current practice, an existing platform, and GlamShare

Feature	Social Media Groups (Local Practice)	Rent the Runway (International Platform)	GlamShare (Proposed System)
Centralized booking system	No	Yes	Yes
Search & filter by size/color/price	No	Yes	Yes
Real-time availability tracking	Manual, error-prone	Automated	Automated
Peer-to-peer reviews & ratings	No	Yes	Yes
Local dress owners' model (P2P)	Yes	No (Retailer-owned inventory)	Yes
Suited to local market & currency	Yes	No	Yes
Secure online payment gateway	No	Yes	Not Included in Current Scope

As shown in Table 2.1, GlamShare aims to combine the structural strengths of both worlds: the peer-to-peer, locally relevant structure of the social media groups, with the organization, automation, and trust features of established commercial platforms.

2.5 Proposed System

Based on the identified limitations of current systems and the findings of the literature review, GlamShare is proposed as an integrated solution that combines centralized reservation management, user-friendly navigation, and trust-building mechanisms into a single web platform.

The proposed system provides several core features, including:

- User registration and secure login authentication.
- Dress listing management (uploading images, pricing, and descriptions).
- Searching and filtering dresses by category, size, color, and rental price.
- Dynamic reservation and booking management via interactive calendars.
- User feedback reviews and rating subsystem.

- Profile management and personal dashboards.
- Historical tracking of user reservations.
- Administrative control panel to manage users and moderate dress listings.

Compared with the current manual system, GlamShare offers a more reliable, efficient, and user-friendly solution, grounded in the trust and convenience factors identified in the literature review.

2.6 Feasibility Study

- The feasibility study was conducted to evaluate whether GlamShare can be successfully analyzed, designed, and implemented across technical, economic, operational, legal, and schedule dimensions.

2.6.1 Technical Feasibility

These technical components are proposed for future implementation: the system can be developed using modern web technologies such as HTML5, CSS3, JavaScript, React for the frontend, Node.js and Express.js for the backend, and MySQL or MongoDB for database management. These technologies are widely available, well-documented, and highly suitable for building scalable web applications. Furthermore, the development team has already acquired solid baseline knowledge of these tools through prior university coursework.

2.6.2 Economic Feasibility

The analysis and design phase requires zero financial investment since open-source modeling tools and frameworks are used throughout. For future implementation, estimated costs are strictly limited to domain registration and basic cloud hosting services, both of which are highly affordable for a startup system at this scale, making GlamShare financially viable.

2.6.3 Operational Feasibility

The system is designed with a strong focus on user experience (UX). Its intuitive, clean interface requires no specialized training and accommodates users with varying technical backgrounds. This ensures high operational feasibility, especially since target users are already accustomed to social media interfaces.

2.6.4 Legal Feasibility

The proposed system complies with general privacy principles by protecting users' personal information and limiting data access according to defined system roles (such as clients, dress owners, and system administrators). Terms of service and rental agreements will be structured within the system boundaries to regulate user responsibility and avoid disputes.

2.6.5 Schedule Feasibility

The analysis and design milestones are highly achievable within a single academic semester. By dividing responsibilities among the four team members and strictly following systematic software design phases, all deadlines can be met.

Table 2.2 maps out the estimated schedule timeline, distinguishing the current design work from future implementations.

Phase	Estimated Duration	Key Deliverable	Phase Status
Planning	**1 week**	**Approved project proposal and initial scope definitions**	**Completed**
Analysis	**2 weeks**	**Requirements elicitation, survey data analysis, and SRS**	**Completed**
Design	**3 weeks**	**UML blueprints (Use Case, Activity), ERD, and UI wireframes**	**In Progress**
Implementation	**6 weeks**	**Core application modules development**	***Planned Future Phase***
Testing	**2 weeks**	**Unit, integration, and user acceptance testing**	***Planned Future Phase***
Deployment	**Ongoing**	**Prototype cloud deployment and maintenance layouts**	***Planned Future Phase***

2.7 Methodology (SDLC)

The Software Development Life Cycle (SDLC) provides the foundational framework for managing GlamShare. Although this specific project report focuses explicitly on the system analysis and design artifacts, the SDLC establishes a rigorous blueprint to guide future physical implementation.

The project adopts the Incremental Model, in which the system is planned to be analyzed, designed, and developed in successive functional increments. The Incremental Model was specifically selected because it allows the system to be divided into small functional modules, making it easier for a small academic team to analyze, design, and validate each module independently.

The system lifecycle consists of the following phases:

- Planning: Identifying the system's core idea, establishing baseline objectives, and defining boundaries.
- Analysis: Eliciting functional and non-functional requirements through the user survey questionnaire and identifying target system inputs and outputs.
- Design: Formulating the relational database schema, Entity-Relationship Diagrams (ERD), structural UML diagrams, and high-fidelity UI wireframes.
- Implementation: *[Planned Future Phase]* Developing the actual web application codebases using the selected technical stack.
- Testing: *[Planned Future Phase]* Executing verification strategies, including unit, integration, and user acceptance testing (UAT).
- Deployment & Maintenance: *[Planned Future Phase]* Deploying the system prototype to cloud web servers and planning system patches.

2.8 Chapter Summary

This chapter reviewed the academic literature on fashion rental, compared the current informal local practice with an established commercial platform, and used both to justify the design of GlamShare. The feasibility study confirmed that the project is technically, economically, operationally, legally, and practically achievable within the academic semester, and the Incremental SDLC model was selected as the methodology best suited to the project's scope, team size, and timeline. The following chapter presents the system analysis and design in detail.

CHAPTER THREE

SYSTEM ANALYSIS AND DESIGN

3.0 Chapter Introduction

This chapter provides a comprehensive breakdown of the system analysis and design phases for the GlamShare platform. Moving from the initial business problem to architectural execution, this section details the methodology used for user requirement gathering, formats these requirements into structured functional and non-functional specifications, models the flow of data across system entities using Data Flow Diagrams (DFDs), and specifies the architectural design of the application.

3.1 System Analysis

System analysis for GlamShare began with a structured requirement-gathering phase aimed at translating the problem identified in Chapter One and the proposed solution outlined in Chapter Two into concrete, verifiable system requirements. Because no dedicated dress-rental platform currently exists for the local market, the team prioritized primary data collection directly from potential users over reliance on existing system documentation. This iterative approach directly aligns with the Incremental SDLC framework established for the project. The following sections describe the technique used to collect requirements, present and interpret the results obtained, and derive the structured requirement set that guided the subsequent system design.

3.1.1 Requirement Collection

The primary technique adopted for requirement collection was an online questionnaire, as it allows structured and quantifiable feedback to be gathered efficiently from potential users.

The questionnaire was created using Google Forms under the title "GlamShare Questionnaire." Key setup details include:

- **Bilingual Design: Written in both Arabic and English to ensure full comprehension by all participants.**
- **Sample Size: Kept open until 40 completed responses were collected from target users.**
-

The questionnaire was structured into three sequential parts:

- **Part One – General Information: Collected demographic data (age groups) to identify the primary target audience.**
- **Part Two – Problem Definition & Current Situation: Evaluated current dress-use habits and challenges with renting through informal social media channels, such as double-booking issues.**
- **Part Three – Proposed System Requirements: Assessed the importance of candidate features for GlamShare (interactive calendar, search filters, reviews system, and owner dashboard), concluding with an open-ended suggestion prompt.**

3.1.1.2 System Service Request(SSR)

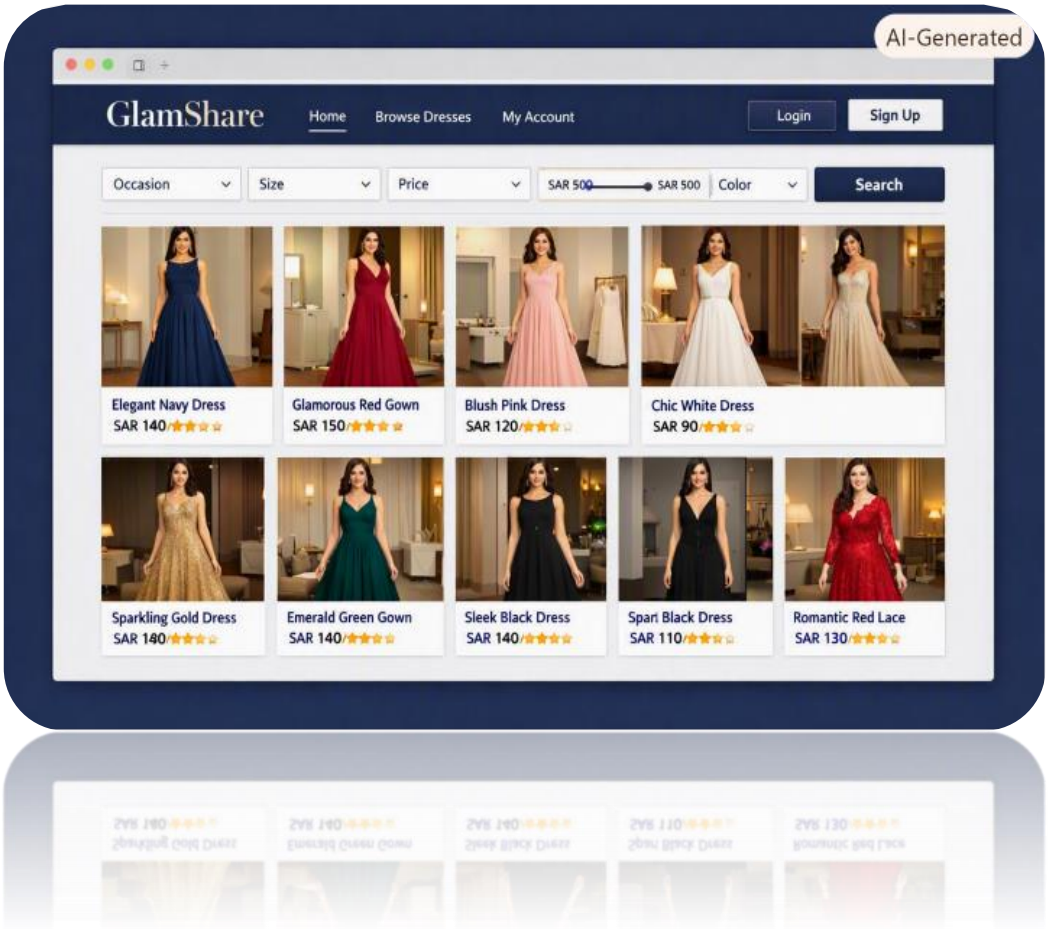

The following System Service Request (SSR) summarizes the business need that motivated the development of GlamShare. It defines the project objectives, expected business value, project scope, stakeholders, and feasibility from a software engineering perspective. The SSR serves as the formal request for initiating the analysis and design of the proposed system.

Item	Description
Project Name	GlamShare: Online Platform for Renting and Reserving Occasion Dresses
Project Description	GlamShare is a web-based platform designed to connect dress owners with renters by providing an organized and secure environment for browsing, reserving, and managing occasion dresses.
Business Need	The local market currently lacks a centralized platform for renting occasion dresses. Existing rental activities mainly rely on social media pages, leading to scattered information, communication difficulties, unavailable booking records, and frequent double-booking conflicts.
Business Requirements	Develop a web-based platform that enables dress owners to publish and manage dress listings, allows renters to search and reserve dresses, supports an interactive availability calendar, ratings and reviews, reservation management, and administrator supervision.
Business Value	The proposed system reduces unnecessary spending on occasion dresses, increases dress utilization, improves reservation efficiency, provides additional income opportunities for dress owners, and promotes sustainable fashion practices.
Expected Users	Dress Renters, Dress Owners, and System Administrator.
Project Scope	The project focuses on the analysis and design of the GlamShare platform, including requirements analysis, UML modeling, database design, and user interface design. The implementation phase is not included in this project
Expected Benefits	Provide a centralized reservation platform, minimize booking conflicts, improve user trust through ratings and reviews, simplify communication between renters and owners, and enhance the overall rental experience.
Constraints	Limited project duration, academic project scope, limited availability of real-world users during the requirements elicitation phase, and the current version does not include an integrated online payment gateway.
Priority	High Priority

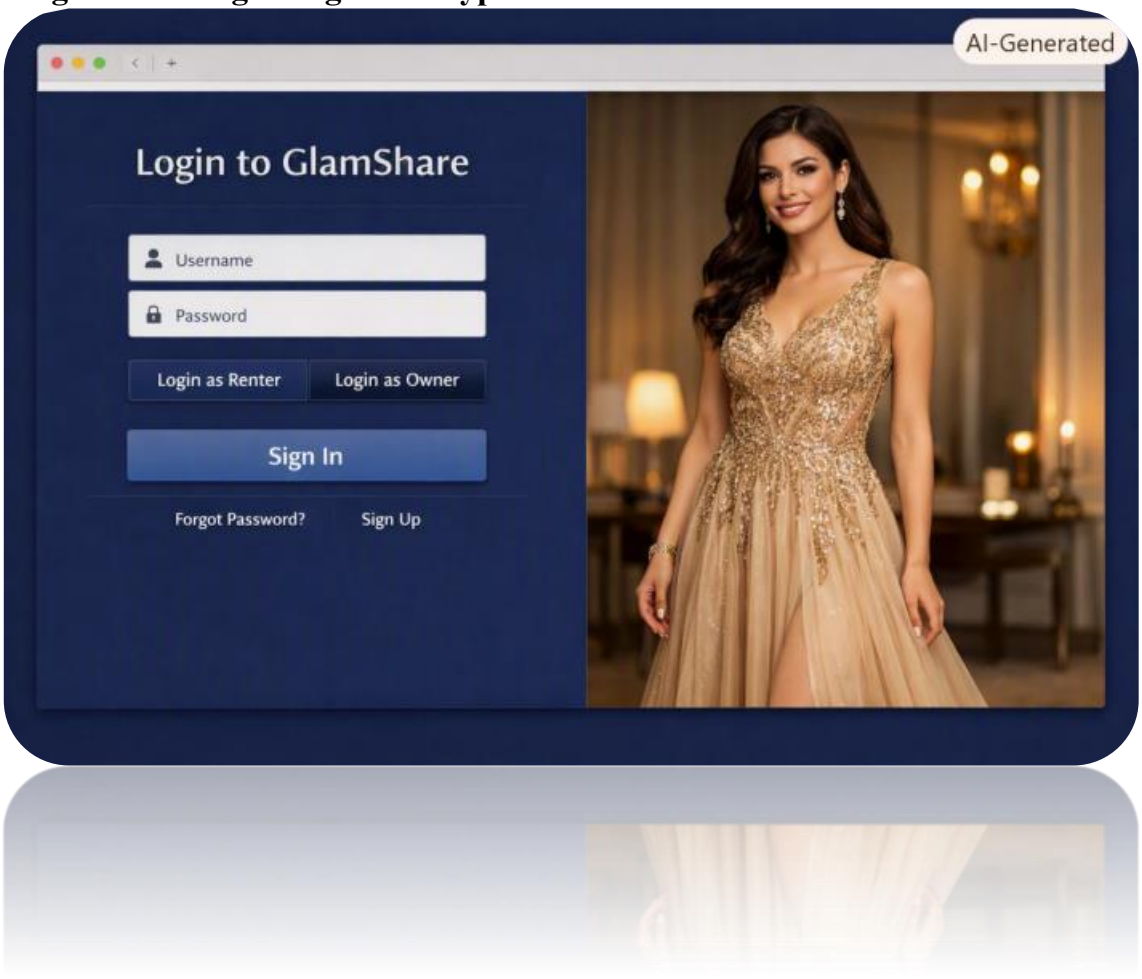

3.1.1.3 Prototype

The prototype was developed to visualize the proposed user interface before implementation and to validate the system requirements gathered during the questionnaire phase. It allows potential users to understand the expected functionality and provide feedback before the detailed system design is finalized. The prototype focuses on the main interactions within GlamShare, including user authentication, browsing dresses, searching and filtering, viewing dress details, making reservations, and managing dresses for owners. The interface was designed with simplicity, usability, and responsiveness in mind to ensure that users can easily navigate the platform. The following figures present the preliminary user interface prototype developed for GlamShare.

• Figure 3.6: Home Page Prototype

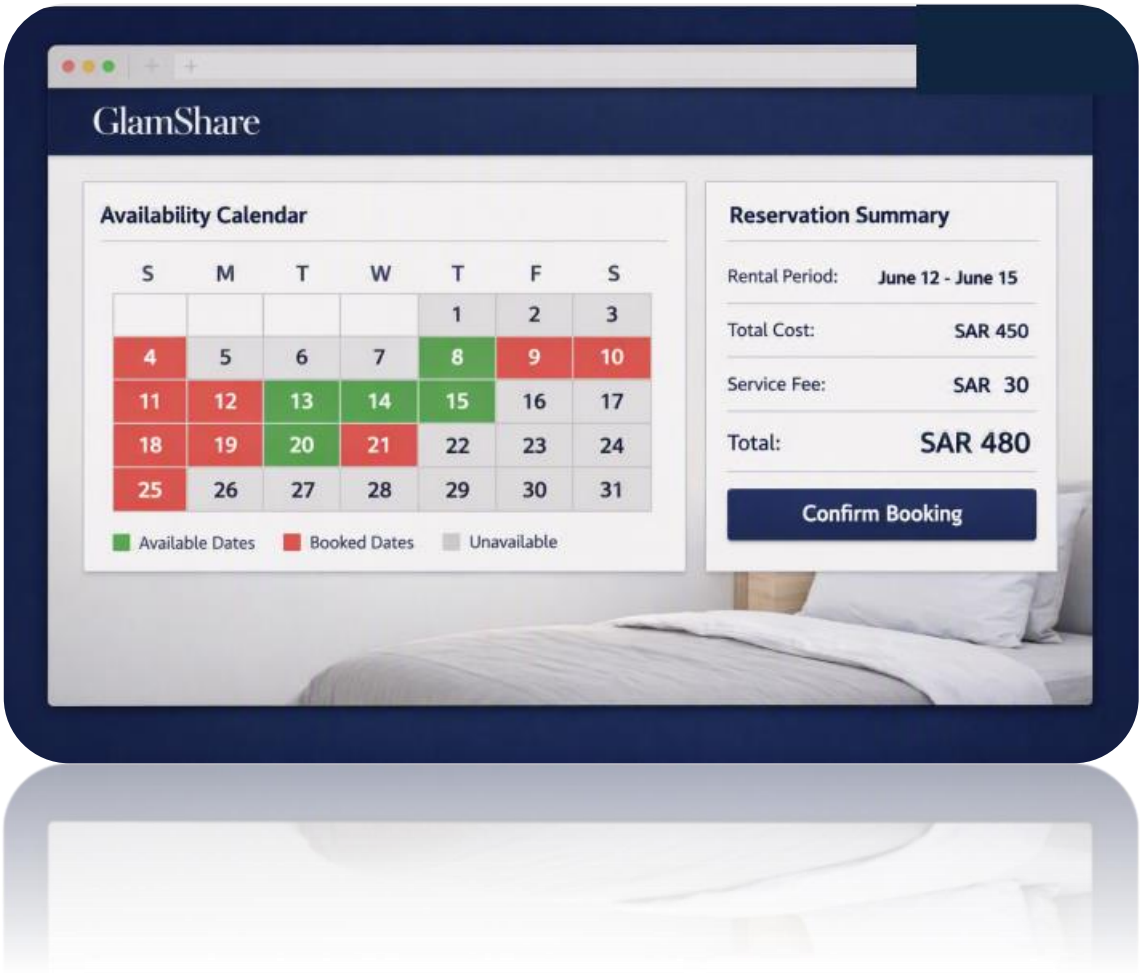

• **Figure 3.7: Login Page Prototype**

• **Figure 3.8: Dress Details Prototype**

• **Figure 3.9: Reservation Page Prototype**

• **Figure 3.10: Owner Dashboard Prototype**

3.1.2 Requirement Studied

The questionnaire received 40 completed responses. This section presents and interprets the collected data, question by question, and links each result to corresponding requirement or design decision for GlamShare. Table 3.1 summarizes the key results before the detailed discussion and figures that follow.

Table 3.1: Summary of Key Questionnaire Results

Question	Topic	Key Result
Q1	Age group	62.5% aged 18–24; 20% aged 35+; 12.5% aged 25–34; 5% under 18
Q2	Own occasion dresses rarely worn	90% Yes
Q3	Frequency of buying a new dress per occasion	40% every occasion; 32.5% once/twice a year; 27.5% rarely
Q4	Biggest difficulty finding a dress via current channels	50% scattered/unclear info on price, size, colour; 27.5% no guarantee between parties; 12.5% unsure of availability; 10% slow responses
Q5	Experienced a double-booking conflict	20% Yes; 35% No, but worried; 45% No, never faced it
Q6	Importance of an interactive availability calendar	72.5% very important; 22.5% medium importance

Q7	**Most important search filters (multi-select)**	**Type/occasion 65%; Price 57.5%; Colour 52.5%; Location 42.5%; Fabric 35%; Size 17.5%**
Q8	**Ratings & reviews increase trust/comfort**	**75% definitely; 22.5% probably**
Q9	**Value of an owner dashboard (bookings/revenue)**	**60% very useful; 32.5% probably useful**
Q10	**Additional suggestions (open-ended, 14 responses)**	**Multiple photos/videos; accurate size & price info; secure booking/payment; clear exchange/return policy; affordable pricing; location filter**

Respondent Profile. The majority of respondents (62.5%) were between 18 and 24 years old, followed by 20% aged 35 and above, 12.5% aged 25–34, and 5% under 18 (Figure 3.1). This confirms that GlamShare's core audience is young adult women, consistent with the university and early-career demographic the platform is expected to serve first.

Figure 3.1: Age distribution of respondents (Q1)

Ownership and purchase behaviour further confirmed the underlying problem described in Section 1.3: 90% of respondents reported owning at least one occasion dress that they rarely wear, and 40% said they purchase a new dress for every occasion they attend, with a further 32.5% buying once or twice a year (Figure 3.2). Together, these results validate the financial-waste problem

motivating GlamShare and support its core value proposition of enabling reuse through rental.

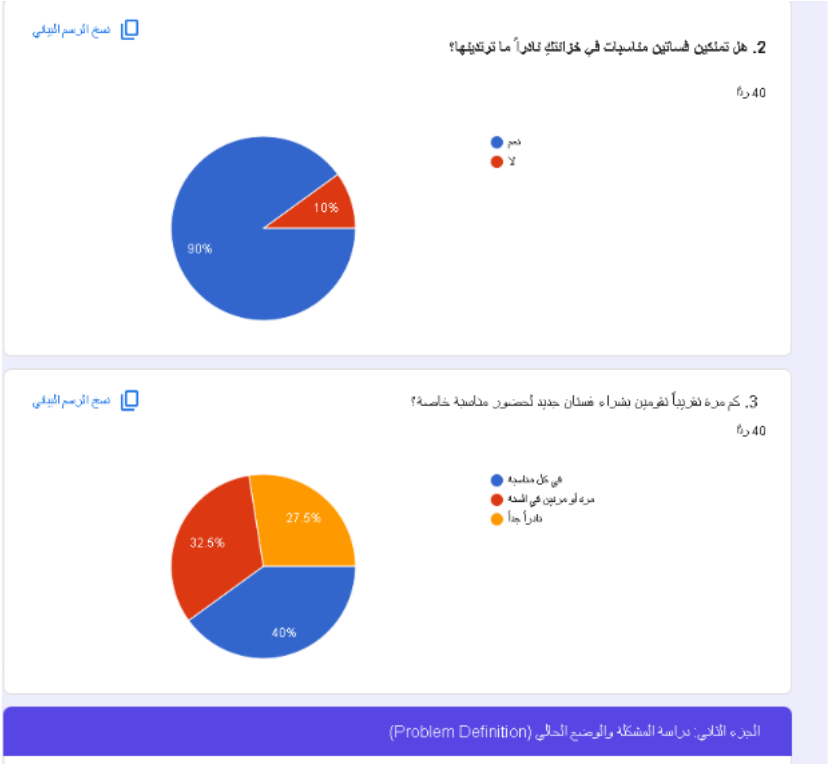

Figure 3.2: Dress ownership and purchase frequency (Q2, Q3)

Current Pain Points and Scheduling Risk. When asked about the biggest difficulties they face searching for a dress through current informal channels, 50% of respondents cited scattered or unclear information about price, size, and suitable colour, 27.5% cited a lack of guarantee or protection between the two parties, 12.5% cited not knowing whether a dress was actually available on the desired date, and 10% cited slow responses from page owners. Scheduling risk was confirmed directly as well: 20% of respondents reported having already experienced a double-booking conflict when renting a dress, and a further 35% had not yet experienced one but were concerned about it — meaning that more than half of respondents (55%) view double-booking as a real or likely risk (Figure 3.3). These findings directly justify GlamShare's centralized booking system and, in particular, the interactive availability calendar as a core requirement rather than an optional feature.

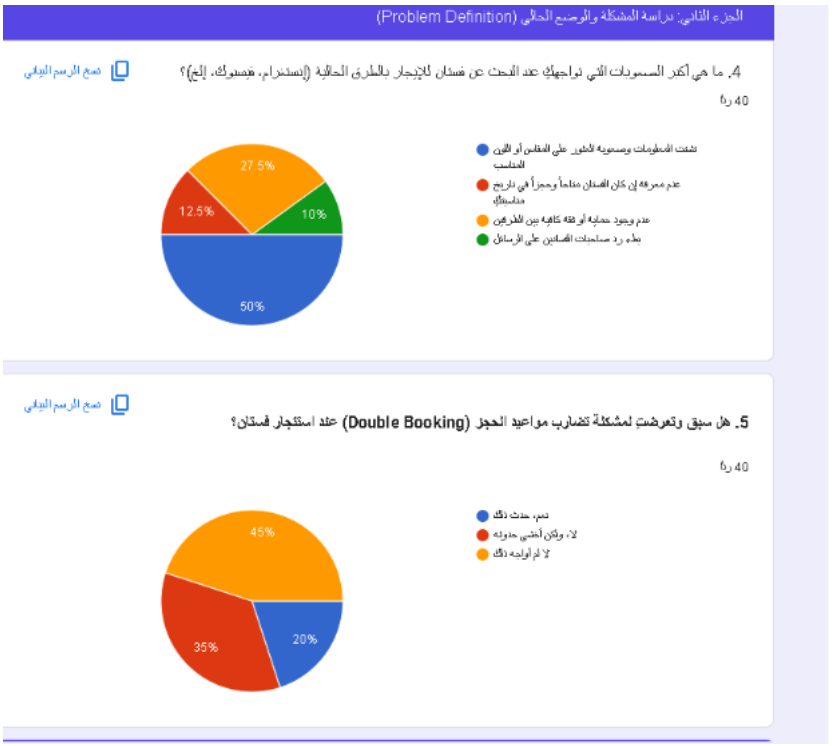

Figure 3.3: Difficulties with current rental channels and exposure to double-booking (Q4, Q5)

Feature Priorities. This priority was confirmed when respondents were asked directly about the importance of an interactive calendar showing a dress's available and booked days: 72.5% rated it “very important” and a further 22.5% rated it of “medium importance.” Respondents were also asked which search and filter criteria mattered most when looking for a dress, with multiple selections allowed; dress type/occasion (65%), price (57.5%), and colour (52.5%) were the most frequently selected criteria, followed by location/city (42.5%), fabric (35%), and size (17.5%) (Figure 3.4). This ranking directly informed the prioritization of GlamShare's search and filtering module described in Section 2.5, ensuring that the most requested filters are given the most prominent placement in the interface.

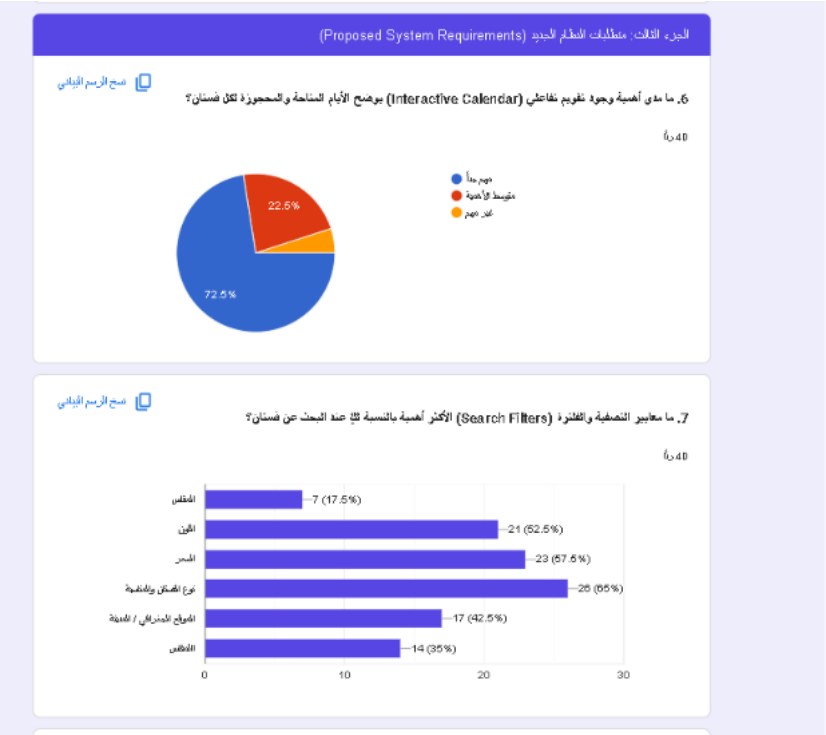

Figure 3.4: Importance of the interactive calendar and priority of search filters (Q6, Q7)

Trust and Owner-Side Requirements. Trust-related features were also strongly validated: 75% of respondents said a ratings-and-reviews system would definitely increase their comfort and confidence when transacting through the platform, and a further 22.5% said it probably would, together representing 97.5% of respondents. Among respondents who own dresses, 60% said a simple owner dashboard for tracking bookings and rental income would be “very useful,” and 32.5% said it would “probably” be useful, confirming strong demand for the owner-side dashboard feature proposed in Section 2.5 (Figure 3.5).

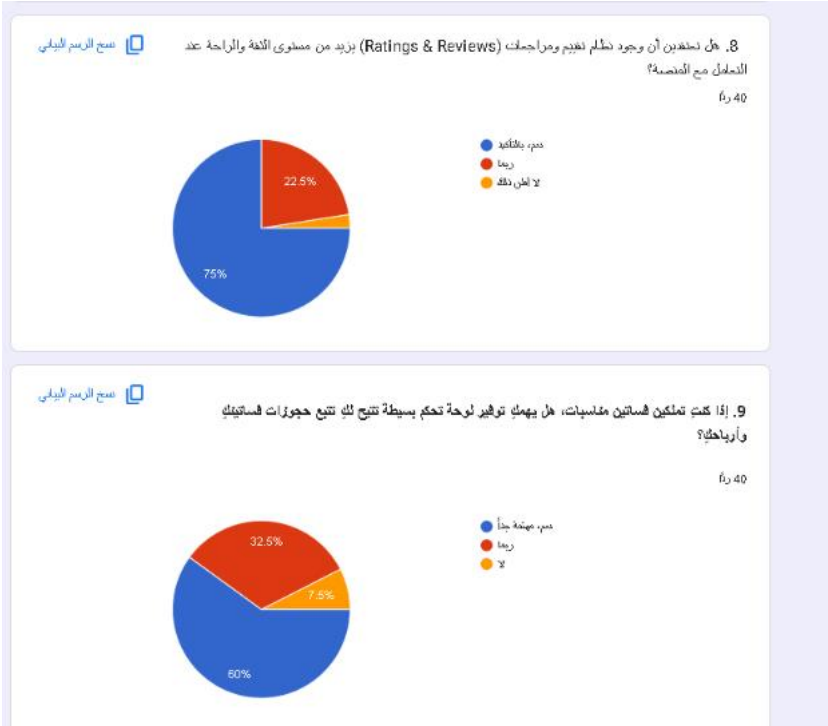

Figure 3.5: Perceived value of the ratings and reviews system and the owner dashboard (Q8, Q9)

Open-Ended Feedback. Finally, respondents were asked an open-ended question on additional suggestions for making the dress-rental and reservation experience easier and safer. Of the 14 respondents who answered, recurring themes included providing multiple clear photographs and short videos of each dress, disclosing accurate size and fabric information alongside customer ratings, offering a secure electronic booking and payment process with a clearly stated exchange or return policy, keeping prices accessible to a wide range of budgets, and allowing filtering by location. These open responses reinforce and add nuance to the closed-question findings above, and were incorporated into the structured requirement set presented in the following section.

Overall, the questionnaire results provide strong empirical support for each of the core features proposed for GlamShare in Section 2.5: the interactive booking calendar, multi-criteria search and filtering, the ratings-and-reviews subsystem, and the owner dashboard. These findings form the evidentiary basis for the structured functional requirements presented in Section 3.1.3.

3.1.3 Structured Requirements

Based on the empirical findings from the questionnaire in Section 3.1.2, the system requirements for GlamShare are categorized into Functional Requirements (FRs) and Non-Functional Requirements (NFRs). These requirements define the specific operations the platform must execute and the quality attributes it must maintain.

1. Functional Requirements (FRs)

The functional requirements specify the actions and services that GlamShare provides to its primary entities: **Renters, Dress Owners, and System Administrators.**

Table 3.2: Functional Requirements Specification

Req ID	Actor	Feature Name	Description & Functional Specification
FR-01	Guest	**Guest Browsing**	The system shall allow guests to search and filter dress listings without creating an account.
FR-02	All Users	**Authentication & Profile Management**	The system shall allow users to register, log in securely using email and password, and manage personal profile details.
FR-03	Renter	**Multi-Criteria Search & Filtering**	The system shall enable renters to filter dresses by occasion type, price range, color, city location, fabric, and size.

FR-04	Renter	**Interactive Availability Calendar**	The system shall display each dress's real-time visual calendar, clearly indicating booked and available dates.
FR-05	Renter	**Reservation Request Submission**	The system shall allow a renter to select available dates and submit a reservation request for a chosen dress.
FR-06	System / Renter	**Concurrency & Double-Booking Prevention**	The system shall automatically prevent a reservation from being submitted or confirmed if the selected dates overlap with an existing booking.
FR-07	Renter	**Ratings & Review System**	The system shall allow a renter who completed a rental period to submit a star rating and written review for the dress and owner.
FR-08	Dress Owner	**Dress Listing Management**	The system shall enable dress owners to create, edit, update, or remove dress listings, including photos, sizing charts, and daily rental rates.
FR-09	Dress Owner	**Owner Analytics & Calendar Dashboard**	The system shall provide dress owners with a dedicated dashboard to manage booking schedules, availability, and item statuses.

FR-10	Dress Owner	**Financial & Revenue Reporting**	The system shall calculate and display total and per-listing rental revenue earnings to the dress owner.
FR-11	System Administrator	**User & Content Moderation**	The system administrator shall have full privileges to inspect, suspend, or remove user accounts and dress listings that violate platform policies.
FR-12	All Users	**Rental History Record**	The system shall maintain a historical record of all past reservations, statuses, and transactions for each user account.
FR-13	**Renter**	**Reservation Status Tracking**	**The system shall allow a renter to view the current status of their past and upcoming reservations.**
FR-14	**Renter**	**Reservation Cancellation**	**The system shall allow a renter to cancel a confirmed reservation prior to its start date, subject to the platform's cancellation policy.**
FR-15	**Dress Owner**	**Availability Management**	**The system shall allow a dress owner to manage a dress's availability calendar independently of editing its listing details.**
FR-16	**System Administrator**	**Platform Reporting**	**The system shall allow an administrator to view platform-wide reports on users, listings, and reservation activity.**

2. Non-Functional Requirements (NFRs)

The non-functional requirements specify the operational quality standards, platform performance, and security rules for GlamShare.

Table 3.3: Non-Functional Requirements Specification

ReqID	Category	Requirement Description & Specification
NFR-01	Usability	The user interface shall be intuitive and responsive, allowing a first-time user to search and complete a reservation without prior training.
NFR-02	Performance	Search, catalog filtering, and page load results shall be returned within an acceptable response time (target under 2 seconds) under normal operating conditions.

NFR-03	**Reliability & Data Integrity**	**The database management system must enforce strict transaction locks to guarantee that double-booking for the same dress date range is impossible.**
NFR-04	**Security & Privacy**	**User passwords and sensitive personal data shall be stored using industry-standard secure hashing and encryption algorithms, with data access strictly restricted by user role.**
NFR-05	**Availability**	**The application infrastructure must maintain continuous system availability with an uptime target of at least 99% (24/7 access).**
NFR-06	**Scalability**	**The database and application architecture shall accommodate a growing number of users, listings, and simultaneous requests beyond the initial deployment scale.**
NFR-07	**Maintainability**	**The system shall be built using modern modular components and clean codebase architecture to simplify future maintenance and feature additions.**
NFR-08	**Localization**	**The interface and system content shall fully support bilingual operations (both Arabic and English) to match the target market requirements.**

3.1.4 DFDs

Data Flow Diagrams (DFDs) were used to model how data moves between GlamShare's external entities, internal processes, and data stores. Figure 3.6 presents the Context Diagram (Level 0)

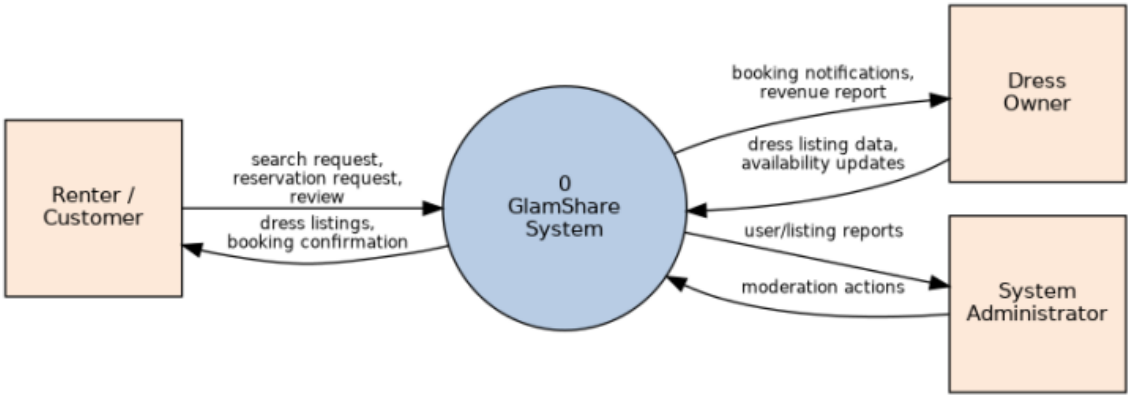

Figure 3.6: Context Diagram (Level 0) of the GlamShare System

As shown in Figure 3.6, GlamShare interacts with three external entities: the Renter/Customer, who submits search and reservation requests and receives listings and booking confirmations; the Dress Owner, who supplies listing and availability data and receives booking notifications and revenue information; and the System Administrator, who issues moderation actions and receives user and listing reports.

3.2 System Design

Building on the structured requirements and data flow models established above, this section presents the detailed system design: the use case diagram, the entity-relationship diagram, the class diagram, a representative sequence diagram, and low-fidelity wireframes of the proposed user interface (prototype).

3.2.1 Use Case Diagram

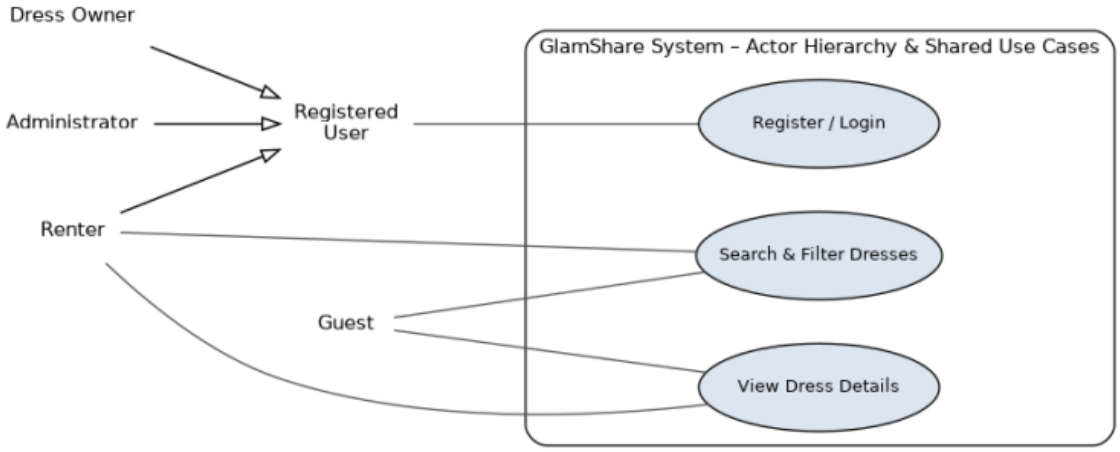

Figure 3.8a: Use Case Diagram – Actor Hierarchy (Generalization) and Shared Use Cases

Figure 3.8a formalizes the functional requirements in Table 3.2 and shows the actor hierarchy: Renter, Dress Owner, and Administrator all generalize (inherit) from an abstract Registered User actor, since all three share the Register/Login use case rather than each triggering it independently. The Guest, who is not registered, connects directly to the Search & Filter Dresses and View Dress Details use cases, and a Renter — already covered for Register/Login through its generalization relationship — has the same access to those two use cases plus the role-specific use cases shown in Figure 3.8b.

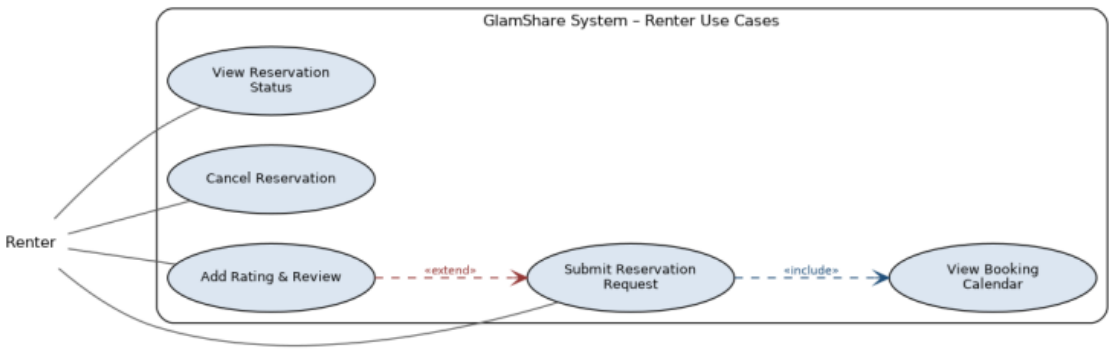

Figure 3.8b: Use Case Diagram – Renter Use Cases with «include» and «extend»

Figure 3.8b details the Renter's use cases at a finer grain than a single “Reserve a Dress” action: Submit Reservation Request (traced in the sequence diagram,

Figure 3.11, and implemented by submit Reservation() in Section 4.2.4) has an «include» relationship to View Booking Calendar, since checking availability is a mandatory step every time a request is submitted. Add Rating & Review has an «extend» relationship onto Submit Reservation Request, since reviewing is optional and only becomes available once a reservation is complete. Two further use cases, View Reservation Status and Cancel Reservation, let the renter track and manage their existing bookings after submission.

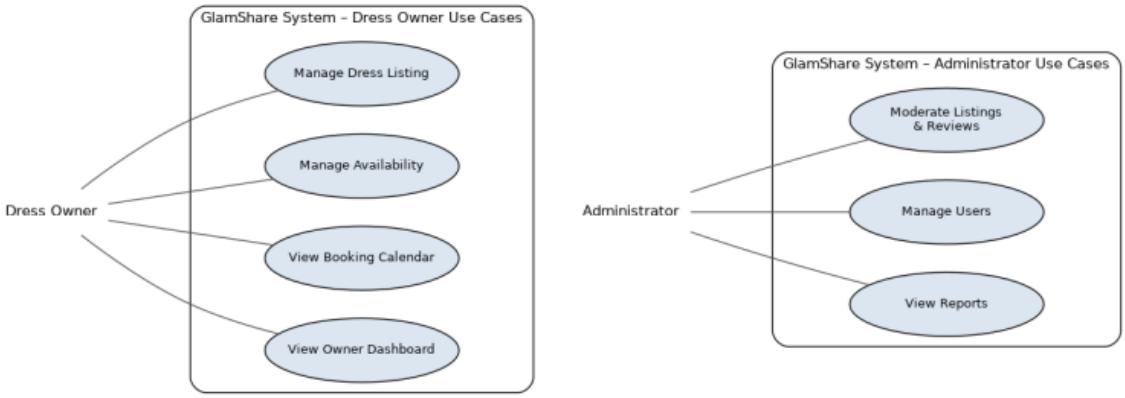

Figure 3.8c: Use Case Diagram – Dress Owner and Administrator Use Cases

Figure 3.8c completes the use case model. The Dress Owner manages listings (Manage Dress Listing) and, separately, day-to-day availability (Manage Availability), reflecting that a listing's static details and its live calendar are updated at different times and by different actions; the owner also views the shared booking calendar and a personal dashboard summarizing bookings and revenue. The Administrator moderates content (Moderate Listings & Reviews), manages user accounts (Manage Users), and can view platform-wide reports — an addition beyond the original requirement set that supports future oversight of platform activity and has been added to Table 3.2 as FR-16.

3.2.2 Entity-Relationship Diagram (ERD)

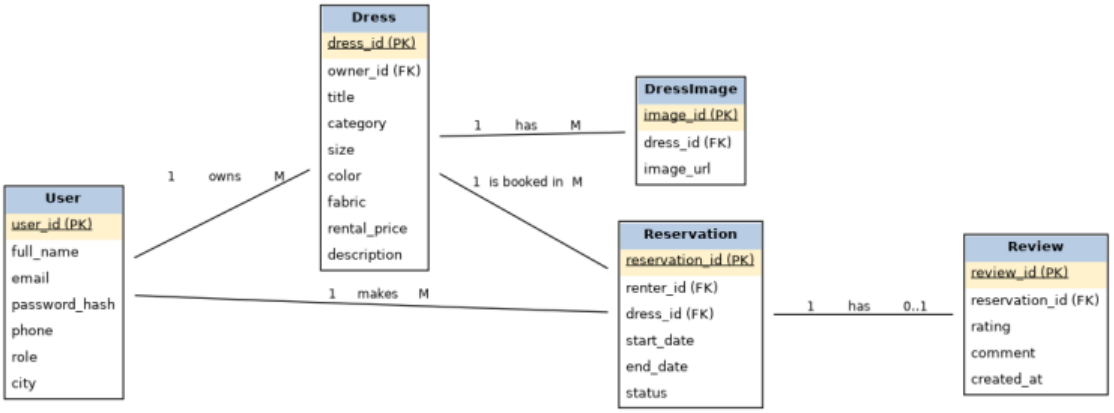

Figure 3.9: Entity-Relationship Diagram of the GlamShare Database

The ERD in Figure 3.9 models the relational database schema underlying GlamShare. A single User (identified by role) can own many Dress records (one-to-many) and can make many Reservation records. Each Dress can appear in many Reservation records over time, and each Reservation may optionally result in one Review once it is completed, reflecting the ratings-and-reviews requirement (FR-7). Each Dress can also have multiple DressImage records to support the photo galleries requested by respondents in the open-ended feedback (Section 3.1.2).

3.2.3 Class Diagram

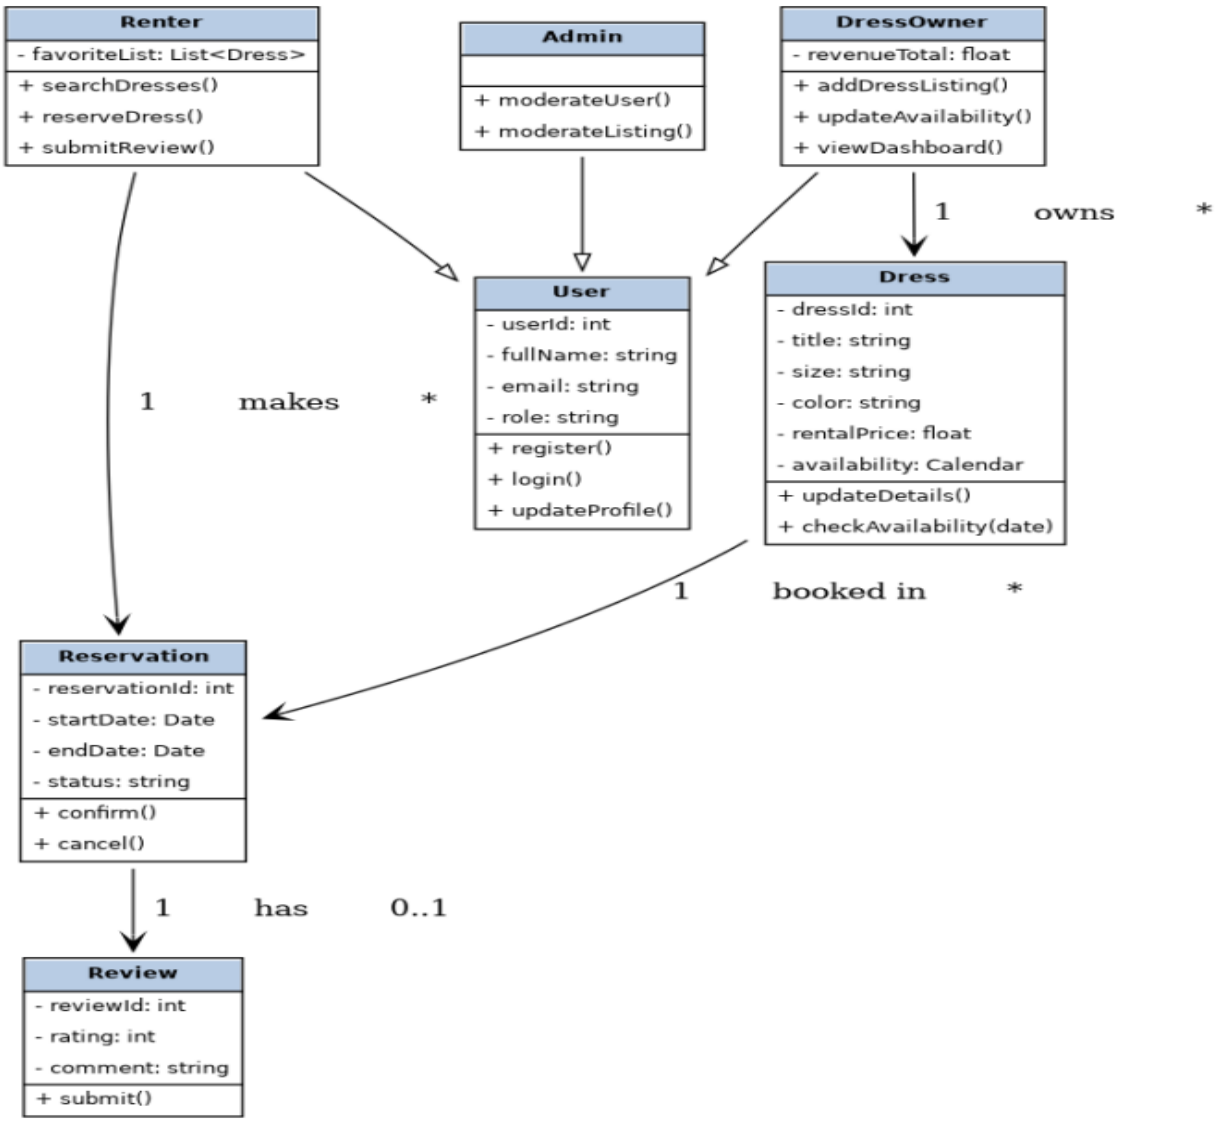

Figure 3.10: Class Diagram of the GlamShare System

Figure 3.10 presents the object-oriented class structure that mirrors the ERD. Renter, DressOwner, and Admin all inherit common attributes and behaviour (registration, login, profile management) from a base User class, while adding role-specific attributes and methods — for example, DressOwner adds a revenueTotal attribute and a viewDashboard() method (FR-9, FR-10), while Renter adds a favoriteList attribute and a reserveDress() method (FR-5).

3.2.5 Scenarios

The following use case scenarios provide textual specifications for the most important interactions. Each scenario defines the actor, preconditions, main flow, alternative flow, and postconditions.

Use Case ID	UC-01
Use Case Name	User Login
Primary Actor(s)	Renter, Dress Owner, or Administrator
Preconditions	The user has an active account.
Main Flow	1. The user opens the login page. 2. The user enters email and password. 3. The system validates the credentials. 4. The system creates a session. 5. The user is redirected to the appropriate dashboard.
Alternative Flow	If credentials are invalid, the system displays an error and allows another attempt.
Postconditions	The user is authenticated and authorized according to the assigned role.

Use Case ID	UC-02
Use Case Name	Search and Filter Dresses
Primary Actor(s)	Renter

Preconditions	At least one dress listing exists in the system.
Main Flow	1. The renter opens the dress catalog. 2. The renter enters keywords or filter values. 3. The system retrieves matching available dresses. 4. The system displays the results. 5. The renter selects a dress to view details.
Alternative Flow	If no dress matches the criteria, the system displays an empty-results message and allows filters to be modified.
Postconditions	Matching dress information is displayed; no system data is changed.

Use Case ID	UC-03
Use Case Name	Submit Reservation Request
Primary Actor(s)	Renter
Preconditions	The renter is logged in and the selected dress is active.

Main Flow	1. The renter selects rental dates. 2. The system checks availability in real time. 3. The renter confirms the request. 4. The system automatically creates the reservation with Confirmed status if the dates are available. 5. The system notifies the dress owner. 6. The system displays the confirmed reservation to the renter.
Alternative Flow	If the selected dates overlap an existing confirmed reservation, the system rejects the request immediately and prompts the renter to select alternative dates.
Postconditions	A confirmed reservation exists for the renter, and the dress owner has been notified. No manual approval step is required, consistent with the automatic double-booking prevention described in Section 3.2.4.

Use Case ID	**UC-04**
Use Case Name	Add Rating and Review
Primary Actor(s)	Renter
Preconditions	The renter is logged in, the reservation is completed, and no review has been submitted for it.
Main Flow	1. The renter opens completed reservations. 2. The renter selects a reservation. 3. The renter enters a rating and comment. 4. The system validates eligibility. 5. The system saves the review. 6. The system displays a confirmation message.
Alternative Flow	If the reservation is not completed or already reviewed, the system prevents submission.
Postconditions	The review is stored successfully and is available for viewing by other users.

Chapter Four

System Implementation

Introduction

This chapter presents the proposed implementation aspects of the GlamShare system based on the requirements and system design developed in the previous chapters. Since the current project focuses on system analysis and design and does not include actual programming implementation, this chapter describes the proposed technologies and illustrates the main user interfaces and reports through design mockups. These proposed implementation elements demonstrate how the system could be developed in the future while maintaining consistency with the identified system requirements and UML models.

4.1 Programming Languages and Technologies

Although the current GlamShare project focuses on system analysis and design rather than actual software implementation, this section presents the proposed programming technologies and database system that could be used in a future implementation of the platform. The selected technologies are based on their suitability for developing a web-based reservation system and their compatibility with the requirements identified in the previous chapters.

4.1.1 Why Using JavaScript, React, Node.js, and Express.js

JavaScript:

JavaScript is a widely used programming language for web development. It can be used to implement interactive features and dynamic behavior within the GlamShare platform. JavaScript is suitable for handling user interactions, form validation, searching, filtering, and reservation-related functions.

React:

React is a JavaScript library used for building interactive and reusable user interfaces. It is suitable for GlamShare because the system contains several user interface components, such as dress listings, search and filtering options, reservation forms, user profiles, and review sections. React allows these components to be organized and reused efficiently.

Node.js:

Node.js is a JavaScript runtime environment that can be used to build the server-side part of the proposed system. It can handle requests from users, communicate with the database, and support different system operations such as user authentication, dress management, and reservation processing.

Express.js:

Express.js is a lightweight web framework for Node.js that can be used to create the server-side application programming interfaces (APIs) required by GlamShare. It can organize communication between the user interface, application logic, and database.

Together, these technologies provide a suitable environment for developing the proposed GlamShare web platform in the future.

4.1.2 Why Using MySQL Database

MySQL is a relational database management system that can be used to store and manage the data required by GlamShare.

The proposed system contains several types of structured information, including user accounts, dress listings, reservations, reviews, and availability information. MySQL is suitable for this type of system because it organizes data into related tables and supports relationships between different entities.

For example, the proposed database may contain tables for:

- **Users**
- **Dresses**
- **Reservations**
- **Reviews and Ratings**
- **Favorites**
- **Availability**

The relationships between these tables can help maintain data consistency and support important system operations such as checking dress availability, managing reservations, and retrieving user information.

MySQL was selected as the proposed database technology because it is widely used, well documented, and suitable for relational systems such as GlamShare.

4.2 Proposed Implementation

4.2.1 Introduction

This section presents the proposed implementation environment of the GlamShare system based on the analysis and design developed in the previous chapters. Since the current project focuses on software analysis and design and does not include physical programming implementation, the interfaces presented in this chapter are proposed user interface designs and mockups that demonstrate how the system could be implemented in the future.

The proposed interfaces are designed according to the system requirements and use cases identified during the analysis phase. They focus on simplicity, usability, and clear navigation for both dress owners and customers.

The main proposed interfaces include user registration and login, dress listing, dress reservation, and reviews and ratings.

4.2.2 Sample of Forms

4.2.2.1 Registration and Login Form

The Registration and Login interface allows users to create an account and securely access the GlamShare platform.

The registration form would allow a new user to provide basic information such as name, email address, phone number, and password. After registration, the user could log in using the registered credentials.

The proposed interface would provide separate access according to the user's role and allow users to manage their profiles and interact with the system.

Figure 4.1: Registration and Login Form Interface

4.2.2.2 Dress Listing Form

The Dress Listing interface is designed for dress owners who want to add their dresses to the GlamShare platform.

The form would allow the owner to enter important information about the dress, including:

- **Dress name**
- **Description**

- **Size**
- **Color**
- **Style**
- **Occasion**
- **Rental price**
- **Availability**
- **Dress images**

This information allows customers to understand the characteristics of each dress and makes searching and filtering more effective.

Figure 4.2: Dress Listing and Image Upload Form Interface

4.2.2.3 Reservation Form

The Reservation interface allows customers to request a dress for a specific period.

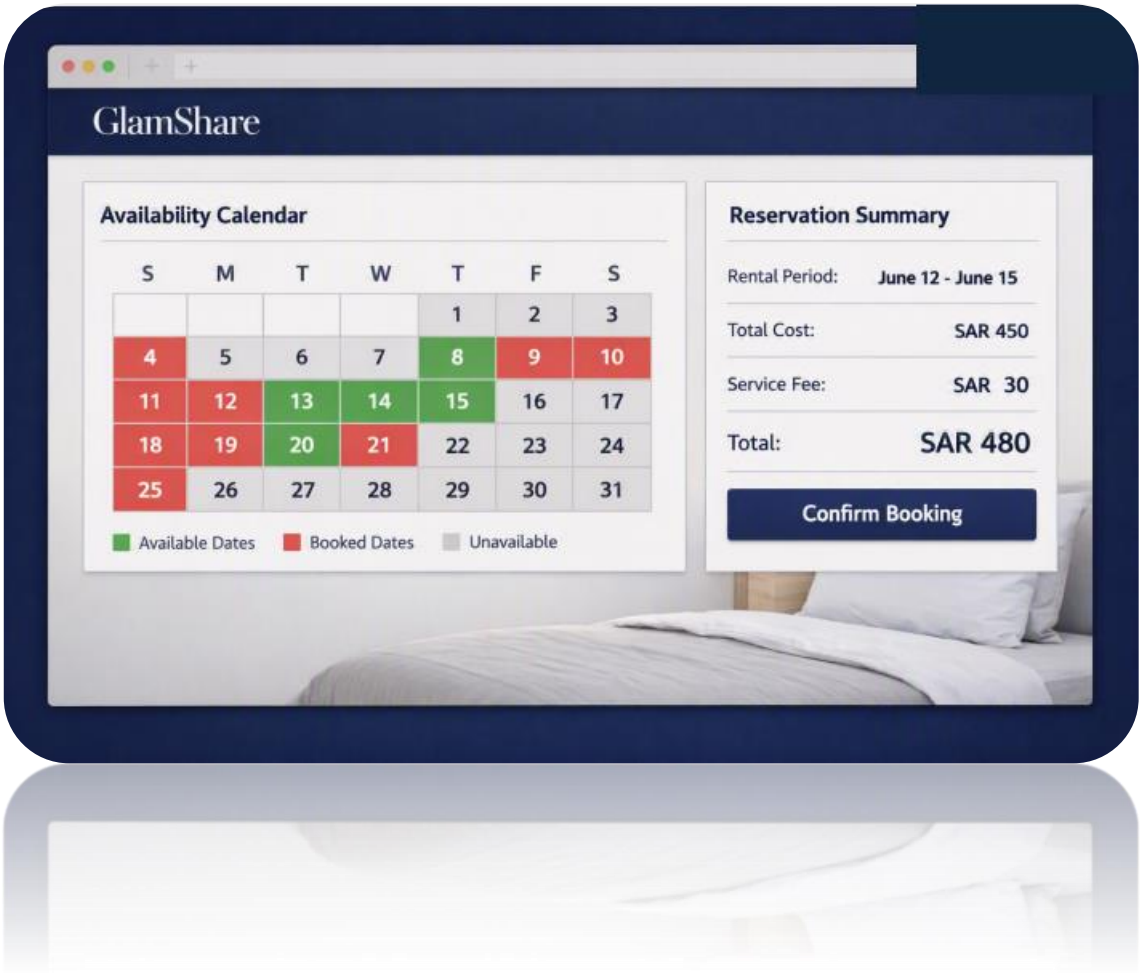

The customer would select the desired dress and rental dates. The system would then display the availability of the selected dress through the proposed reservation calendar.

The interface is designed to reduce scheduling conflicts and help customers understand whether the dress is available before submitting a reservation request.

The proposed reservation process includes:

1. **Select a dress.**
2. **View dress details.**
3. **Select the required rental dates.**
4. **Check availability.**
5. **Submit the reservation request.**
6. **Receive the reservation status.**

Figure 4.3: Reservation Request Form Interface

4.2.2.4 Review and Rating Form

The Review and Rating interface allows customers to provide feedback after completing a rental.

Customers can submit a rating and write a review about their experience with the dress and the rental process.

This feature is intended to improve transparency and trust between users. It can also help future customers make better decisions when selecting dresses.

Figure 4.4: Review and Rating Submission Form Interface

4.2.3 Sample of Reports

Although actual reports will not be implemented during the current analysis and design project, the following reports are proposed as examples of reports that could be generated if GlamShare is implemented in the future.

4.2.3.1 Rental History Report

The Rental History Report would allow users to view their previous and current rental activities.

The report could include information such as:

- **Dress name**
- **Reservation date**
- **Rental period**
- **Reservation status**
- **Rental price**

This report would help customers keep track of their reservations and previous rental activities.

Figure 4.5: Proposed Rental History Report

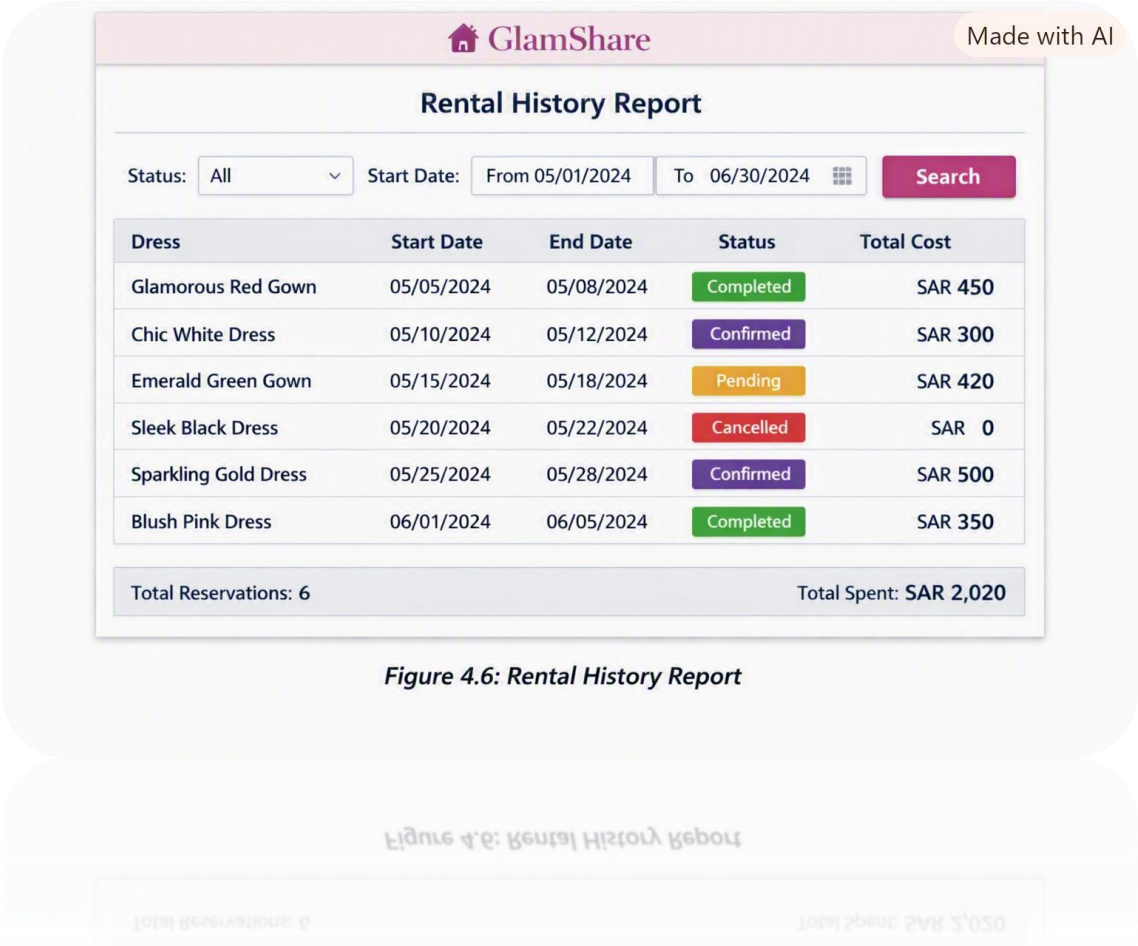

Figure 4.6: Rental History Report

4.2.3.2 Dress Owner Earnings Report

The Dress Owner Earnings Report would provide dress owners with an overview of the income generated through their rented dresses.

The report could include:

- **Dress name**
- **Number of rentals**
- **Rental dates**
- **Rental price**
- **Total earnings**

This report would help dress owners monitor the performance of their listed dresses and understand the financial benefits of using the GlamShare platform.

Figure 4.6: Proposed Dress Owner Earnings Report

Figure 4.7: Platform Overview Report

4.3 Chapter Summary

This chapter presented the proposed implementation environment of the GlamShare

system. The proposed technologies, including JavaScript, React, Node.js, Express.js, and MySQL, were selected based on their suitability for developing the system in the future.

The chapter also presented examples of the main user interfaces and reports that could be included in the GlamShare platform. These interfaces were designed according to the requirements and system models developed in the previous chapters.

Since the current project focuses on software analysis and design, actual programming, deployment, and system implementation are outside the scope of the current project. The proposed implementation details provide a clear foundation for future development of the GlamShare system.
